

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase 6: Project Testing Phase

6.1 Testing Objective

The objective of the testing phase is to validate the end-to-end functionality of the automated procurement process from the user's perspective. Testing confirms that a Standard Laptop order placed through the Service Catalog passes through the approval stage and automatically generates a correctly configured catalog task for the Hardware team.

6.2 Test Environment

Platform: ServiceNow (Global application scope).

Catalog Item Under Test: Standard Laptop (Service Catalog > Hardware).

Automation Under Test: "Standard Laptop task" flow (Active), bound to the catalog item via the Process Engine tab.

Test Data: One Standard Laptop order with quantity 1.

6.3 Test Execution Steps

The following test steps were executed in sequence:

1. **Placed the order:** navigated to Service Catalog > Hardware, opened the "Standard Laptop" item, and clicked "Order Now".
2. **Verified order submission:** confirmed the order status screen displayed "Thank you, your request has been submitted" along with Request Number REQ0010001 and the estimated delivery date.
3. **Opened the request record:** selected the request number to open the REQ record and reviewed the Approvers related list.
4. **Processed the approval:** confirmed the approval entry for the request, completing the approval stage of the workflow.
5. **Opened the requested item:** from the Requested Items related list, opened the RITM (RITM0010001) record and scrolled to the Catalog Tasks section.
6. **Verified the catalog task:** opened the generated task SCTASK0010001 and validated its field values against the flow configuration.

6.4 Test Results & Verification

The catalog task generated by the flow was inspected and verified against the expected configuration:

- **Short Description:** "Laptop needs to Configured" — updated automatically as defined in the flow action.
- **Description:** "Laptop needs to Configured" — matches the configured field value.
- **Approval:** Approved — set automatically by the flow.
- **Assignment Group:** Hardware — the configuration task is routed to the correct team.
- **Request Item:** RITM0010001 — correctly linked to the originating requested item.
- **State:** Open — the task is active and ready for fulfillment by the hardware team.

6.5 Outcome

All test steps executed successfully. The flow triggered on the service request, the approval was processed, and a single catalog task (SCTASK0010001) was automatically created with the correct short description, description, approval status, and Hardware assignment group. The automated procurement and configuration workflow is verified as functioning end-to-end, fulfilling the project objectives of reduced manual intervention and timely laptop configuration.
