

Phase 3: Project Design Phase

3.1 System Architecture & Flow Design

The project design centers on replacing legacy Workflows with a modern, low-code Flow Designer architecture. The flow logic follows a linear trigger-action pattern:

Trigger Component:

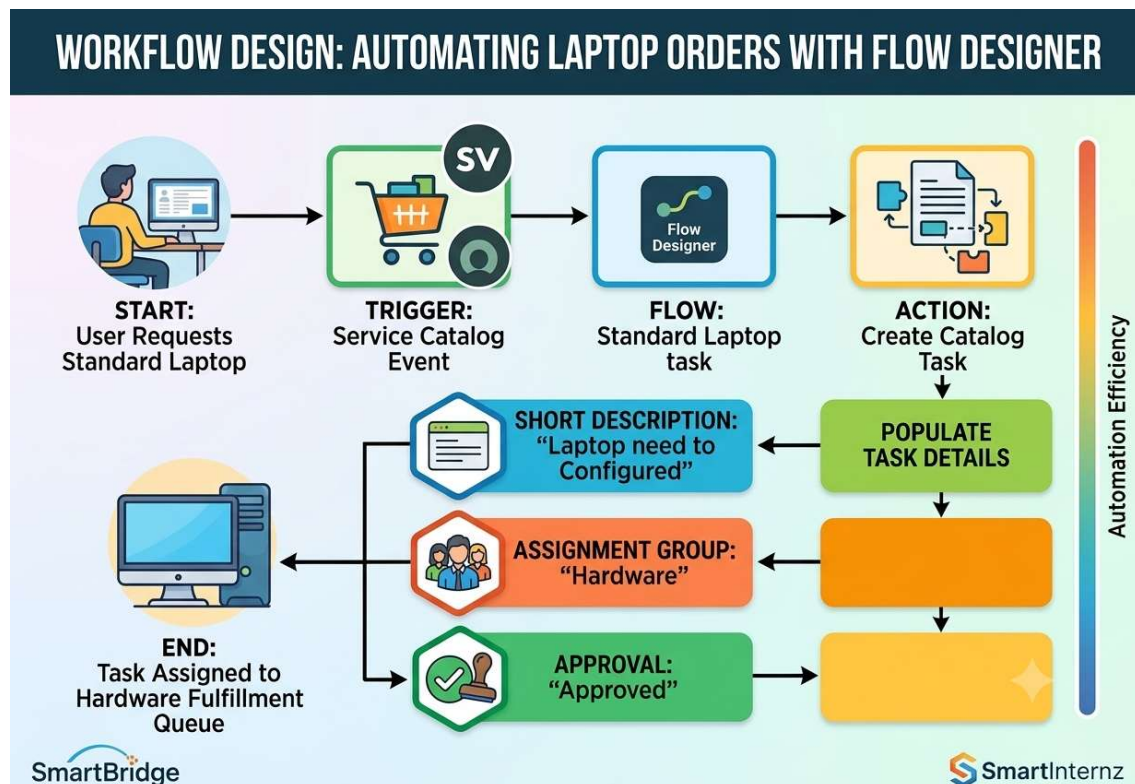

Behavior: Listens for incoming Service Catalog Requests (sc_req_item).

Action Component:

Action Name: Create Catalog Task (sc_task).

Data Binding: Binds the Requested Item Record dynamically from the Trigger data pills into the Action input.

3.2 Process Mapping & Workflow Design

3.3 Catalog Item Mapping Strategy

Target Item: Standard Laptop (Service Catalog > Maintain Items).

Process Engine Configuration:

Legacy Workflow: Cleared/Detached.

Flow Mapping: Linked to Standard Laptop task flow.

Activation: Flow state set to Active to ensure real-time execution.
